The following is a compilation of various forecasts made by Canadian pollsters, academics, data scientists and interested observers. We compile both seat and vote forecasts. Riding-level projections are currently being compiled and will be made available within a week. Our objective is to have a catalogue of official forecasts for the purposes of comparing accuracy across various methods after the election. In the event that we have missed any forecasts, please contact Peter Loewen at peter.loewen@utoronto.ca.

Also included in the tables are the experimental “nowcasts” we have generated in the interest of testing and model building; they are not model derived, and are therefore likely largely incorrect. However, in the interest of transparency, they can be found here. For information on how each nowcast was generated, please see [this document](#).
